NOVUS — demo script

`game.akshatchowdhary.online` · teacher demo `/teach/sample` · `root / 12345`
5 minutes · open both tabs before you start · sound on for the trailer only

Before they sit down: two tabs open — the game (a save already on day 7), and the sample dashboard already past the login. Wi-fi off is survivable: everything but the news links works offline.

The one line to land: every other finance game scores you on money. Novus scores you on **reasoning** — and that is what the teacher sees.

	DO THIS	SAY ROUGHLY THIS
0:00	**The front door** Landing page. Don't play the trailer.	"Novus is a city that runs on money. You take finance jobs, judge real loan files and trade a live market — and you are graded on your reasoning, never on your luck. That one decision is why there is a teacher behind it."
0:30	**Make one call** Academy → Drills → The credit desk. Read the file aloud, commit a risk band, then choose.	"Prakash wants six lakh for new compressors. The building is leased — the only security is the plant, worth about a quarter of the exposure. I commit my read first, then my call. Approving against that collateral is not protection, and the game marks the reasoning, not whether I got lucky."
1:30	**The thing nobody else logs** Academy → Mistakes.	"Every slip is logged by **type** — traded the noise, judged a call by how it turned out, one name holding most of the book. Not a score. A habit. Hold that thought."
2:00	**Switch tabs: the teacher** Class report. Point at "What to teach next".	"Twelve students, a week of play. The dashboard doesn't say "class average 61%". It says **seven of twelve keep trading the noise**, and the credit desk isn't landing for five of the eleven who tried it. That is Thursday's lesson plan, and it falls out of work the students already did."
2:45	**Two leaderboards that disagree** Same page, top-left card.	"A class wants a leaderboard. Rank them on money and you have taught them to gamble. So there are two. Learning — work passed, accuracy, improvement. Trading — profit, and it says in its own words that it is partly luck. **Farhan is top of the market and bottom of the work.** That gap is the conversation."
3:20	**One student** Student report → Farhan Qureshi.	"Never "weak at credit". It says: best 3 out of 5 across two tries, last on Thursday, up 20 points since the first go. Evidence he can argue with — which is the only feedback worth giving."
4:00	**The close: act on it** Scroll to "What to set them next" → press *Set it for Farhan*.	"It names one exercise, aimed at the habit he keeps repeating, and sets it for him alone — not the class. The pick is a rule I can show you. **TinyFish** brings the other half: Reuters and Bloomberg, this year, on what that exact mistake cost India's retail traders. The model never chooses the homework — a recommendation a teacher can't audit is worse than none."
4:40	**Stop talking** Leave the dashboard on screen.	"Students learn by living with their decisions. Teachers get the habits behind the marks. And the market is invented from end to end, so nothing here is ever advice."

IF THEY ASK

Is the AI picking the exercise? No. A rule picks it; TinyFish fetches current reading for the teacher. Deliberate — "the model said so" is not a reason to drill a student.

What's real? The Casebook cases and the teacher's reading list. Every tradable company, price and loan file is invented, on purpose: real tickers turn a learning game into advice.

Privacy? A teacher sees attempts and a shared summary. Never a save, cash, or a transcript. Enforced in Postgres, not in the screen — 24 checks in `tools/sql`, all passing.

Built with? React, Phaser, Supabase, TypeScript. Rules, world and interface kept in separate layers so the market stays testable.

IF IT BREAKS

Dashboard empty? You're on `/teach`, not `/teach/sample`.

Asked to log in again? New tab clears it — `root / 12345`.

No network? Everything works except the two news links. Say so and keep going.

Game won't load a save? Start a new one; the credit desk drill needs nothing.

Running long? Cut 1:30 (Mistakes) and 3:20 (one student). Never cut 2:45 or 4:00 — the two boards and the recommendation are the demo.

NUMBERS TO HAVE READY

12 students · **11** sharing progress · **24 of 36** pieces of work attempted, **15** passed.

7 of 12 trade the noise. **5 of 11** haven't cleared the credit desk.

Farhan: **11th** of 11 on learning, **1st** on trading, habit logged **×4**.

Bloomberg, Aug 2026: India's retail traders lost **$9.6bn** in equity derivatives — the same mistake, outside the game.
